

A large number of network security devices already exist

Overview

The main types of network security devices include firewalls, intrusion protection systems (IPS), unified threat management (UTM) systems, network access control (NAC), email security gateways, web application firewalls (WAF), and VPN gateways. A key strategy in network security is the multi-layered defense approach, known as defense-in-depth, which ensures that if one layer fails, others will continue to protect the network. These devices act as barriers between the internal network and potential threats from the outside world. What Are Network Security Devices?

Network Security. In our new study, the 2025 Device Security Threat Report, we analyzed over 27 million connected devices belonging to 1,803 enterprise network customers to reveal a critical truth: there is a massive visibility gap across unmanaged, managed and IoT devices. This way, you can protect your network and prevent. Network security solutions are specialized hardware devices designed to protect networks from cyber threats, and modern innovations like Juniper Mist networking for secure, scalable infrastructure further enhance visibility, automation, and overall network performance. These appliances are deployed.
