

Cable TV Closed-Line Optical Cable

Overview

Cable television is a system of delivering television programming to consumers via radio frequency (RF) signals transmitted through coaxial cables, or in more recent systems, light pulses through fibre-optic cables. This contrasts with terrestrial television, in which the television signal is transmitted over-the-air by radio waves and received by a television antenna, or satellite television, in which the signal is transmitted from a satellite in space. To receive cable television at a given location, cable distribution lines must be available on the local utility poles or underground utility lines. The signal is then brought to the customer's building through a cable. In the most common system, multiple television channels (as many as 500, although this varies depending on the provider's available channel capacity) are distributed to subscriber residences through a cable. The very first cable networks were operated locally, notably in 1936 by the British Post Office in London in the United Kingdom and the same year in Berlin in Germany, notably for the distribution of news, and from 1948 onwards in the United States.
