

## Can fiber optic cables be used without fusion splicing testing

### Overview

In today's networks, two methods are used to connect fibre-optic cables: Pre-assembled fibre optic cables or modules that have been equipped with plug-in connectors and tested in the factory. These are simply plugged together on site and do not require elaborate splicing. Splicing is typically required during cable installation, maintenance, or network expansion. The goal is to achieve the lowest possible optical loss (signal). Regardless of your level of experience, creating high-quality, high-performance fiber optic networks requires developing your skills in fusion splicing. A mass fusion splicer welds 12-fiber together. Pre-terminated cables simplify aerial installations by connecting distribution points directly to buildings without splicing, reducing labour costs and accelerating deployment. For network managers and technicians, a poor splice can lead to significant signal degradation, network downtime, and costly troubleshooting.
