

Can optical splitters be used in a computer room Why

Overview

When employing the first-level splitting method in a residential network, optical splitters offer flexibility for indoor or outdoor installation. Indoor options encompass locations like the community's central computer room, building's weak current well, or floor wiring box. A fiber optic splitter is a passive optical component that divides a single incoming optical signal into two or more outgoing signals, or combines multiple incoming signals into one. Its primary function is to split the optical signal of one input optical fiber into multiple optical signals and transmit them to. An optical splitter is a small, passive device—no power needed! —that splits one incoming light signal into multiple identical outputs. You'll often see ratios like 1:8, 1:16, 1:32, or even 1:64, which tell you how many ways the signal is divided.
