

Dual-mode optical cable splicing method

Overview

It describes three main splicing methods - de-matable connectors, mechanical splices, and fusion splices. Fusion splicing welds two fibers together using an electric arc and provides the lowest loss. What is Fiber Optic Splicing and Why is it Needed?

- #1. Unlike connectors, which are used for temporary joints, splicing creates a permanent joint. Fiber optic splicing, crucial for maintaining seamless connectivity in modern communication networks, primarily uses two methods: fusion splicing and mechanical splicing. Another method of connecting optical fibers is termination or connectorization, which consists of processing the end of a fiber optic bundle so that it can be connected to other fibers or devices through fiber optic. Fiber termination refers to the process of preparing the end of a fiber optic cable to connect to another fiber, a device, or a network.
