

Fiber Bragg Grating WDM

Overview

Fiber Bragg gratings are versatile wavelength filters for multiplexing and demultiplexing wavelength division multiplexing (WDM) signals. They also can compensate for chromatic dispersion that can degrade the quality of the WDM signal in an optical fiber. FRANÇOIS OUELLETTE, Kromafibre The advent of wavelength-division-multiplexing (wdm) as the technology of. Fiber Bragg grating (FBG) is a fiber-type grating in which UV fringe forms a periodic refractive index change in the fiber core through the photosensitivity. Abstract: Diode pumped continuous wave all solid state UV-lasers operating at 266nm offer an interesting alternative to frequency doubled Argon ion lasers. We compare photosensitivity, UV- writing of Bragg gratings and thermal decay at 244,257 and 266nm. For short periods of the index modulation, the disorder in index of refraction perturbation induces the light reflection in a limited.
