

Fiber optic cable core routine inspection

Overview

The procedures in this document describe basic inspection techniques and processes of cleaning for fiber optic cables, bulkheads, and adapters used in fiber optic connections. Polished connector ferrules require visual inspection during manufacturing to evaluate polishing and find possible defects during the connector termination process. The cleaning process itself is simple and straightforward. The primary reason for fiber inspection is to ensure that the connectors are free of any defects, damage, or debris that would prevent sufficient transmission of light when mated. This white paper covers the tools and techniques for effective inspection and cleaning of fiber end faces. Network performance is only as good as the weakest link, and the weakest link is wherever a fiber endface.
