

Fiber optic links to switches in communication equipment rooms

Overview

Backbone cabling provides high-capacity interconnections between entrance facilities, equipment rooms, and telecommunications rooms. It typically consists of fiber optic or high-performance copper cabling, supporting gigabit and terabit speeds for large-scale enterprise networks. Network topology refers to the way in which the links and nodes of a network are arranged in relation to each other. The ER typically contains the telephone switching system, the data switching equipment with LAN switching equipment, the CATV “head end” distribution. Panduit Fiber Cabling System simplify the delivery of network services by providing reliable infrastructure components assembled and tested in a factory-controlled environment. Fiber provides: Increased internet signal bandwidth. Most modern fiber-enabled network switches require an SFP transceiver module. Structured cabling is a comprehensive network of cables, equipment, and management tools that enables the continuous flow of data, voice, video, security, and wireless communications.
