

## Functions of the Switch Access Layer

### Overview

It typically sits at the access layer, provides high port density, often delivers PoE, and forwards traffic upstream to the distribution or core layer. Executive Summary: An access switch is the first network device most users and endpoints actually touch. Other important merits include enhanced security through features like TrustSec, which offers controlled access and network. The Switch is a network device that is used to segment the networks into different subnetworks called subnets or LAN segments. An enterprise network is a large network that may contain several campus networks spanning different. In a typical enterprise network architecture, the access layer switch is the first point of contact between end-user devices and the rest of the network.
