

High-speed optical modules are the most advanced

Overview

High-Speed Optical Modules now stand at the center of the AI infrastructure boom. They no longer serve as simple transmission components inside data centers. Instead, they connect computing resources, unlock cluster efficiency, and support the rapid movement of massive data flows. As AI training. This article will explore the evolution of modules' speed and form factor from 400G to 1.6T, discuss speed enhancement technologies, and paths to achieving high-speed optical modules. The substantial increase in traffic volume within data centers and backbone networks has driven a surge in demand. An optical module is a device that converts electrical signals into optical signals and vice versa. Its main function is to convert an electrical signal into an optical signal at the transmitting end, transmit it through an optical fiber, and then convert the optical signal back into an electrical. A high-speed optical modulator is an optoelectronic device that is capable of modulating light signals at a high speed.
