

# How is the relay protection switch triggered

## Overview

Once a fault is detected and located, the protective relay triggers appropriate protective actions. These actions may involve sending a trip signal to a circuit breaker or initiating other control actions to isolate the faulted area and prevent the fault from spreading to other. Protective relays and devices have been developed over 100 years ago to provide “lastline” of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. It functions as a watchdog by constantly surveying multiple system components including voltage, current, frequency, and phase angle. It. In electrical engineering, a protective relay is a relay device designed to trip a circuit breaker when a fault is detected. : 4 The first protective relays were electromagnetic devices, relying on coils operating on moving parts to provide detection of abnormal operating conditions such as. Relion protection and control relays for several application reduce complexity.
