

## Incoming power supply to the primary distribution box at the construction site

### Overview

The primary distribution point, typically connected to the incoming builder's supply (400V three-phase or 230V single-phase from the DNO). A reliable construction site power connection is the foundation for safe workflows, predictable schedules, and the efficient use of electrically powered equipment. This applies to tower cranes, lighting, containers, and tools as well as to hydraulic power packs that supply concrete demolition. Power supply on construction sites is crucial to run all the equipment and tools needed to complete a project. A feeder usually begins with a feeder breaker at the distribution substation. Primary power typically refers to the. Coordination for Incoming Power Work: Prior to conducting any work on incoming power supplies, including electrical service entrance lines from utilities or customer feeds, the contractor must obtain prior notification and approval from either the field representative engineer or an Electrical.
