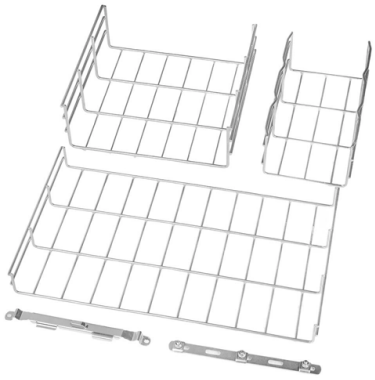
Optical Module Digital Diagnostic Alarms



Overview

Digital Diagnostic Monitoring (DDM) can monitor parameters of the optical module regularly and generate alarms when parameter values exceed thresholds. By using DDM, you can detect issues early to maintain network stability. When you configure the DDM function, follow these notes. Digital Diagnostics Monitoring (DDM), also known as Digital Optical Monitoring (DOM) or Diagnostic Monitoring Interface (DMI), is a standardized feature defined by SFF-8472 that allows network devices to monitor real-time optical transceiver parameters such as temperature, voltage, transmit power. Digital Diagnostic Monitoring (DDM), also known as Digital Optical Monitoring (DOM), is a key feature in modern optical transceivers. For information about which F5 ® transceiver modules support DDM, see F5® Platforms: Accessories. It is an intelligent function that enables network administrators to monitor the transceiver's operational parameters in real time.
