

# Relay Protection Overvoltage Start Principle

## Overview

An overvoltage relay protects electrical equipment from high voltage. It activates when the voltage across its coil exceeds a preset value. This relay is essential for preventing damage caused by voltage spikes, which can occur due to defects or faults in the power supply. Overvoltage can occur due to lightning, switching surges, or sudden. Over voltage relay is an electrical protection device which is used for prevention of exceeding system voltage and operated after crossing pre set value of voltage and time then a tripping signal is provided to the circuit breaker tripping coil. It is used in transformer outgoing isolation panel or.
