

Starting the working principle of relay protection device

Overview

Protection relays mainly work on the two basic principles such as; electromagnetic attraction and induction. A protective relay is an intelligent electrical device designed to detect faults in power systems and initiate corrective actions such as tripping a circuit breaker. Its main purpose is to safeguard electrical equipment like transformers, generators, and transmission lines from damage due to. The objective of this presentation is to convey a basic understanding of protective relays to an audience of engineers already familiar with low voltage protective device coordination. Fundamental concepts and terminology will be taught using the electromechanical overcurrent relay as a foundation. Protective relays and devices have been developed over 100 years ago to provide “lastline” of defense for the electrical systems. For example, unselective protection operation during a medium voltage network fault will cause an outage for an unnecessarily large number of consumers.
