

Testing pigtail model

Overview

A good method for probing a circuit is by soldering a small diameter coax cable or RF pigtail on a PCB as a test probe, in order to inject an input signal or sample an output signal. This disclosure describes techniques for accurate estimation and de-embedding of the effects of pigtail probes in circuits. If applied carefully, they can be used to characterize networks up to and beyond 5GHz. This comprehensive guide will equip you with the knowledge and skills to accurately assess the integrity of a pigtail, helping you identify issues. Local testing before triggering remote builds is essential for optimizing the model development process. I have a problem though, after building the modules and uploading code to the Atmega328 chip and adding it to the board I would like to test the modules for full.
