

# The fiber distribution box needs to be connected to a pigtail

## Overview

Fusion Splicing - Join incoming fiber strands to pigtail terminations inside the FDB, fusing together using a fusion splicer. A fiber distribution box (FDB) functions as a central hub in fiber optic networks where the main cable is split into multiple individual fibers for distribution to end users. These boxes protect sensitive fiber connections from environmental factors while providing an organized framework for. The fiber optic pigtail is a short terminated optical fiber with a connector on one end, used to facilitate easy connections between fiber optic cables and various devices. This article will show you what a fiber optic pigtail is. The access fiber cable can have multi cores, for example, a 4-core cable (cable has four cores), through terminal box, you can splice this optical cable to a maximum of four pigtails, that leads out of 4. Fiber termination box (FTB), also known as optical terminal box (OTB), generally refers to a distribution box specially designed for fiber cable management (fiber patch cables/pigtails) in FTTH applications.
