

## The fiber optic cable is tightly threaded through the conduit

### Overview

A conduit is a protective tube or channel that houses the fiber optic cables, shielding them from moisture, dust, physical stress, and other environmental factors. It also facilitates cable management and ease of maintenance. As a premium brand dedicated to providing high-quality, finished optical network solutions, Gcabling has analyzed countless installations. Innerduct provides a good way to identify fiber optic cable and protect it from damage, generally a result of someone cutting it by mistake! You can get the innerduct with pulling tape already installed. You can eliminate 95% of stalling. Stalls should consider bend radius, tension, jamming, and fill ratio before performing any conduit pull. Corning Optical Communications recommends the American Polywater® PULL-PLANNE cable in conduit, observe the manufacturer's recommendations for maximum pulling tension and bend radius. Find step-by-step instructions and tips for a successful installation. Outdoor cables may be direct buried, pulled or blown into conduit or innerduct, or installed aerially between poles. Indoor cables can be installed in raceways, cable trays above ceilings or under. Fiber optic cable transmits data as light pulses through thin strands of glass or plastic, offering high speed and bandwidth.
