

# The function of an adjustable fiber optic attenuator

## Overview

Attenuators enable the fine-tuning of adjustable signal power and ensure that the signal power reaching the receiver is within its dynamic range, preventing saturation and maintaining the signal-to-noise ratio. An optical attenuator, or fiber optic attenuator, is a device used to reduce the power level of an optical signal, either in free space or in an optical fiber. The basic types of optical attenuators are fixed, step-wise variable, and continuously variable. Usually, such attenuators either have a housing equipped with some type of fiber connectors (e. They do not modify the signal content, wavelength, or transmission path. Also, by preventing overloading, attenuators can increase the lifespan of network. Fiber Optic Attenuators, also known as optical attenuators, are passive devices integral to the management of light power in fiber optic systems.
