If the wavelength, the speed, and the fiber type of the modules are the same, plus operating normally on the original switches separately, then adopting two modules from different . When it comes to the connection between two fiber optic transceivers, the following four factors should be taken into considerations: wavelength, speed, fiber type, and the connection to switches. In a fiber link, the data is transmitted from one end to another, and fiber transceivers are. In today's network deployment, compatible optical modules have been widely used, but users still have concerns about the quality, interoperability, and compatibility of optical modules when choosing them. They are used in fiber optic communication systems to transmit data over long distances with minimal loss and interference. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa.
