

The screen of the fiber melting machine shows the pigtail fiber is positioned too high

Overview

The cause of this failure can be analyzed from the following points: (1) The end face of the fiber is not clean and dusty, or there is debris on the V-shaped groove, or there is debris on the fiber holder. (2) The Angle difference of cutting end face of fiber is too big. Each time when power on, the splicer prompts to confirm that the current fiber type and splice modes are correct. Use the Left/Right buttons to select Yes or No then press Enter, or tap Yes/No on the screen to confirm. Often used with pigtails for connecting 250-micron outside plant fiber to 900-micron inside plant fiber at the building entrance, fusion splicing is achieved with a fusion splicing machine after the fiber is properly. A fiber pigtail is a short length of optical fiber that comes with a high-quality, factory-polished connector already installed on one end, leaving a length of exposed glass on the other.
