

What does 3D inspection of fiber optic patch cords mean

Overview

When producing fiber optic patch cord assemblies, manufacturers use 3D interferometer (which is an optical interferometry instrument) to check the fiber optic connector endface and strictly control the dimensions of the connector endface. Therefore, every fiber cable we sell, whether it is OM1, OM2, OM3, OM4, or OS2 is rigorously tested before it. This article dives into advanced testing methodologies — polarity testing, IL/RL measurement (via OLTS, OTDR, OFDR), 3D endface metrology, and endface inspection — and details how they fit into an OEM/contract manufacturing workflow. We explain the physical principles, standards, and procedural. It's crucial to inspect, clean, and reinspect fiber end faces before mating connectors — whether on patch cords and trunks within the network or on the test reference cord you connect to your tester.
