

What is a three-level power distribution box power cabinet

Overview

Three level distribution box: a distribution box is set under the main distribution box, a switch box is set under the distribution box, and electrical equipment is set under the switch box to form a three-level distribution box. The outgoing line from the low-voltage end of the transformer is 0. These boxes feature bottom entry and exit cables, front-opening doors, and main busbars connected with copper strips for optimal contact. It ensures that electricity is delivered safely and efficiently to different sections of a building or facility. These PDUs are typically used in large data centers for both raised and non-raised floor applications, where they receive incoming power and distribute it to individual racks or groups. (1) Power distribution from the primary main distribution board (distribution cabinet) to secondary distribution boards can be branched; that is, one main distribution board may supply power via multiple branch circuits to several secondary distribution boards. (2) Similarly, power distribution.
