### Overview

A fiber optic patch cable (also called a fiber jumper or fiber patch cord) is a section of optical fiber cable with connector terminations on both ends, designed for flexible, short-distance interconnections within an optical network. It is composed of fiber optic cable and fiber connector that fixed at both ends of optical cable, has been widely used in various fields such as fiber optic. A fiber optic patch cord (fiber jumper) is: Typical applications: A patch cord is the “bridge” that connects two fiber devices and lets them talk to each other. Unlike backbone trunk cables—which are typically multi-fiber. Optical Fiber Patch Cord is the cable assemblies with connector plugs at both ends, used to achieve flexible and plug-and-play fiber optic connections between devices or between devices and fiber optic patch panels. Without them, even the best optical modules and switches cannot deliver performance. As data rates increase from 10G → 100G → 400G → 800G, patch cables must handle more bandwidth, more density, and stricter.
