

## Which is faster an SFP optical module or dual RJ45 ports

### Overview

SFP ports are designed for use with fiber optic cables, which generally offer higher speeds and longer transmission distances compared to the copper cables used with RJ45. An SFP module might support speeds such as 1G, 10G, or even higher, depending on the specific type of module. These ports provide more network design flexibility by using interchangeable transceivers that support several media types, including copper and fiber optic cables. Each has advantages in speed, reach, cost, flexibility, and usage scenarios. This article provides a comprehensive comparison across key SFP modules and RJ45 connectors, are among the most common technologies employed in networking, and indeed make interconnecting of devices possible. While the primary purpose of these devices is to serve as connectors for network equipment, they vary greatly in their utilization, range, speed. This article explains what an SFP module is, what an RJ45 (copper) module or port is, compares them side-by-side with accurate technical numbers, and highlights five real advantages and the best use cases for each option. While RJ45 offers cost-effective, plug-and-play simplicity for spans under 100 meters, SFP interfaces. RJ45 and SFP serve different roles in Ethernet networks.
