

Why is the power consumption of core switches so high

Overview

This is because network switches do not have a flat-rate power consumption. The power consumption of a gigabit switch is. From gigabit switches designed to accommodate high-speed data transfer to Power over Ethernet (PoE) switches capable of delivering power to connected devices, the versatility of network switches underscores their indispensability in modern connectivity ecosystems. The power consumption of a gigabit switch is higher than that of a 100 Mbit/s switch. A Core Switch is a high-performance network switch designed to handle large amounts of data traffic, typically positioned at the center of a network, connecting different subnets, VLANs (Virtual Local Area Networks), or network areas. This standard is different for PoE, PoE+, and PoE++.
